COVID-19 IgG/IgM Detection Kit

(Colloidal Gold)

Rapid results with
10-15 minutes

Simple operation
without machine

Serum, plasma &
whole blood all
applicable

Good for screening
use

■ What is COVID-19

The novel coronaviruses belong to the β genus. COVID-19 is an acute respiratory infectious disease. People are generally susceptible. Currently, the patients infected by the novel coronavirus are the main source of infection; asymptomatic infected people can also be an infectious source. Based on the current epidemiological investigation, the incubation period is 1 to 14 days, mostly 3 to 7 days. The main manifestations include fever, fatigue and dry cough. Nasal congestion, runny nose, sore throat, myalgia and diarrhea are found in a few cases.

■ The advantages of COVID-19 IgG/IgM detection

- After the human body is infected with the virus, the body first produces IgM, following by a large amount of IgG.
- The detection of IgM in the blood indicates a recent infection, used for early diagnosis of infection.
- IgG is produced late and lasts for a long time, used as an indicator of previous infection.

Detection of IgG/IgM helps to judge different stages of viral infection.
